Release of PULSE Firmware Version 1.20

Our new firmware is now moving from the beta phase (v1.13) to release. As a new released firmware it will be called v1.20.

From August 2018, all PULSE dispensers will leave the Gallagher factory with firmware v1.20 installed.

Thank you to those who participated in the beta testing phase, your involvement has been critical in the process.

The new firmware provides access for service agents to a wider range of functions that previously required specialist equipment, laptops or consultation with experts.

Here are some of the new functions and features provided by the new firmware v1.20.

How do I get an upgrade

To upgrade PULSE dispensers to the new firmware v1.20 contact your local service provider.

What if I don't have the new DCE Central Controller?

No problem, v1.20 is backwards compatible and can be installed on previous PULSE central controller hardware.

Where can I get it

The new firmware v1.20 will be available on the Gallagher Support Website from 1 August 2018.

Data Centre Capability

This new platform allows connectivity to the Gallagher Data Centre, provided a DCE Central Controller is fitted.

PULSE dispensers dispatched before May 2017 can acquire the new DCE Central Controller with a simple upgrade.

Enhanced Flow Control

New enhanced flow control functionality works to optimise flow rates based on varying site conditions (degradation of filters, changing number of hoses in use).

Five Product Dispensers

Providing more choice and better access to fuel product for your customers at every dispenser.

Re-Designed Service Menu

The new service menu provides consistency across menu structures and easy access to the most commonly used functions

LPG Menu

The new LPG menu offers the ability to setup, test and calibrate from within the service menu.
